

## **Modulus Technical Note #6 - Demonstration Installation (Windows)** (Amended 10/6/99)

---

### **Operating Systems.**

As a 32-bit application, Modulus will only operate under Windows NT 3.5.1 or later, or under Windows 95 or later. Modulus requires a 486, Pentium, or later processor.

### **CD Drivers Under Windows NT 3.5.1 or 4.**

Not all CD drivers operate properly with Windows NT. If, having loaded your CD, you are unable to get past the Windows OS directory, your CD drivers are probably not 32-bit versions. Contact your hardware supplier for updated drivers. Alternatively, load the CD into a Windows 95 machine, and install Modulus across your network.

### **Memory Requirements.**

Modulus needs a minimum of 16MB of RAM, and preferably 24 megs. More RAM will be required if more than one application is to be run at the same time.

### **Installation.**

Having loaded the CD, go into the File Manager, or My Computer, to view the contents.

Inside the 'Demo' directory, you will find directories labelled '486' and 'Pentium'. Open the one relevant to your computer.

NB. If you are unsure as to which processor your machine has, use the 486 version, as this will run on both 486 and Pentium-based computers.

Double-click the installer found in the directory and then follow the on-screen instructions. The installer will, by default, install into a directory that it will create, called 'MODULUS'. You are given the opportunity to change the name of this destination directory during the installation process, if you wish to do so. If you have problems with the installer try copying the installer onto your hard disk, first, and loading it from there.

### **Loading Modulus for the First Time**

Double-click the Modulus application - labelled "Modulus 4.exe" and located in your newly installed directory. You will be asked to enter a password. Use the table to select the correct one (the uppercase is important).

**User Level**

**Password**

---

Manager	M1	
Manager with Word Processing		M1WP

You will now be asked to locate a data file. Locate and open the 'Tutorial' data file, labelled "Tutorial.4dd". At this point you may see a message saying that a date-update is required - if so, select "update". You will now be asked to enter a User ID. The data file is set up so that you do not need to remember a User ID, so simply click on a member of Personnel in the list and you will be allowed into Modulus. Please note that this demo version will only allow a restricted number of records to be written (up to 200 companies).
